Why go to more than one resource?

Just because you did not find anything in one resource, does not mean it is not valid issue

... try another resource.

The publisher also has an impact on what you can find.

... but just because you did not find anything, does not always mean it is not in the resource.

It may be due to the resource's poor search capabilities, data normalization, your search strategy, etc.

Just because you did not find anything, it could mean studies are not out there!

There may be no funding or regulations to require a study, or the doctor is too busy to write a case up and find a journal.
